EDUCATION

University of British Columbia, BSc in Computer Science

Sept 2021 - May 2025

Relevant Coursework: Distributed Systems, Computer Networking, Relational Databases, Machine Learning

Honours: Undergraduate Open Scholarship, President's Honour Roll, Dean's Honour List

EXPERIENCE

DevOps Engineer Intern — Invoke, Vancouver, BC

Sept 2023 – Dec 2023

- Cut mobile release cycle 6x (60 min → 10 min) by building a Fastlane + CircleCI pipeline for iOS builds, code signing, and App Store deployment
- Shipped production OAuth with Google, Facebook, and Apple via AWS Cognito into a React Native client and Node.js API
- Provisioned infra with Terraform; sped up CI via parallel tests and Docker layer caching; moved secrets to AWS Secrets Manager

Technologies: TypeScript, React Native, AWS, Terraform, Docker, Fastlane, CircleCI

PROJECTS

Parts Search for Collision Shops [getboneyard.com]

- Designed a PostgreSQL parts graph normalizing OEM, aftermarket, and interchange IDs so a part number or VIN fitment returns equivalent listings across suppliers
- Cut per-page DB ops 3,500 → 25 with bulk reads and in-memory classification
- Shipped production search with 162 automated tests (PGLite in CI) and GitHub OIDC deploys with no long-lived AWS keys; vendor plugins for eBay US + CA

Technologies: TypeScript, Next.js, Express, PostgreSQL, AWS Lambda, Terraform, Vercel

AI Review Response App

- Built an iOS + FastAPI app that drafts AI replies to business reviews; Google/Yelp OAuth clients implemented with a local stub until partner API access clears
- Designed a RAG pipeline (pgvector + sentence embeddings) that pulls up to 3 similar past replies as few-shot examples, only when the corpus is large enough and similarity is high enough to trust
- Defended the draft pipeline against prompt injection via system/user role separation and delimited untrusted review text, verified with adversarial prompt-structure tests

Technologies: Swift, Python, FastAPI, PostgreSQL, pgvector, Supabase, GitHub Actions

Distributed Key-Value Store

- Implemented Raft in Go: leader election, log replication, and snapshot log compaction
- Verified linearizability under concurrent clients; fault-injected partitions and crashes

Technologies: Go, Raft

SKILLS

Languages: TypeScript/JavaScript, Go, Python, Java, C/C++, SQL, Bash

Frameworks: Next.js, React, Node.js, Express, FastAPI

Cloud & Infra: Git, AWS (Lambda, Cognito, RDS, API Gateway), Terraform, Docker, GitHub Actions, CircleCI
